

Unified Master Playbook: The 100% Profit Blueprint

THE COMPLETE QUANTITATIVE WORKFLOW TO DOUBLE CAPITAL IN NEPSE

This master guide integrates the three core institutional frameworks of our application: **The One Method (20-Trade Half-Kelly Compounding Engine)**, **The NEPSE Alpha Playbook (T+2 Capital Defense & Market Breadth)**, and **The Confirmed Entry Blueprint (SEBON 2082/2083 Statutory Compliance)**. It eliminates retail gambling and defines an exact, reproducible mathematical routine to achieve 100%+ portfolio growth.

THE 3 HARD REALITIES OF MAKING 100% PROFIT IN NEPSE:

- **Statutory Circuit Volatility (±15%):** Under SEBON's Fourth Amendment Bylaws 2082, single bad trades can crash 15% in a day if caught in a limit-down waterfall.
- **T+2 Delivery Freeze:** Shares purchased today cannot be exited for 2 full trading days. Chasing extended green candles guarantees retail bag-holding.
- **Compounding Math vs. Single Lotteries:** Attempting to make 100% on 1 speculative stock leads to ruin. Sequential compounding (20 trades at 65% win rate and 2.5:1 R:R with 2% portfolio risk) transforms **Rs. 5,00,000 into Rs. 11,69,450 (+134% return)** in 6–10 months.

1. The Master 6-Point Confirmed Entry Matrix

Checkpoint	Target Metric in App	Confirmation Rule	Hard Reject Trigger
1. Action Stance	Stance Banner (Top)	Must be STRONG BUY or ACCUMULATE ON PULLBACK	REJECT if 'HOLD / DO NOT CHASE' or 'AVOID'
2. Setup Score	Setup Score Card	Score ≥ 70 / 100 with High confidence rating	REJECT if score < 65 or bearish consensus
3. Entry Price	Entry Risk Card	LTP inside [Entry Zone] and ≤ Chase Cap (+2.5%)	REJECT if LTP > Chase Cap (+2.5% of pivot)
4. Smart Money	Step 4 Broker Card	Top 3 Brokers account for ≥ 40% of Buy Volume (BCR3)	REJECT if Top Brokers are net distributors
5. Trap Monitor	Radar / Breakout Trap	NO Distribution Trap Alert (No dumping into green)	REJECT if 'Distribution Trap: Do Not Buy' fires
6. Risk : Reward	Multi-Horizon Targets	Minimum 2.5 : 1 Net R:R (Stop-Loss strictly ≤ 4.5% - 5.5%)	REJECT if Stop > 6% or Net R:R < 2.0:1

2. Step 1: The 8-Gate Screener (Finding the Top 1% Scripts)

Open **Services** → **Flagship** → **100% Hunter (8-Gate Screener)** and filter for **6+ Gates**. The application evaluates every NEPSE scrip against 8 institutional filters:

Gate #	Factor	Institutional Standard	Quant Purpose & Anti-Trap Defense
Gate 1	Float Size	Public Float ≤ 15M shares	Prevents liquidity dilution; tight floating supply moves rapidly on institutional demand.
Gate 2	Supply Lock	Promoter Hold ≥ 52% or Stealth ≥ 55	High skin-in-the-game; shields from speculative float dumps.
Gate 3	VCP Squeeze	BBW ≤ 6.5% or pChange ≤ 2.0%	Volatility contraction pattern; precedes violent directional expansion.
Gate 4	Volume Spike	Z_vol ≥ 1.5σ or RVOL ≥ 1.8x	Distinguishes genuine institutional accumulation from low-volume retail churn.
Gate 5	Broker Inflow	Stealth Accumulation Score ≥ 60	Confirms top broker powerhouse cornering (e.g. #58, #45, #34).
Gate 6	Directional DPI	DPI Score ≥ 65 / 100	Measures buyer pressure consistency across intraday tick transactions.
Gate 7	Graham Safety	Margin of Safety ≥ 5% or P/E < 28	Protects downside; eliminates bubbles trading at 8x book value.
Gate 8	Seasonality	Season Score Bonus ≥ 0.00	Guards against pre-Dashain and fiscal year-end liquidity contractions.

3. Step 2: The Wyckoff & Smart Money Broker Audit

Open **Services** → **Flagship** → **Accumulation Radar** to audit market microstructure before entry:

RULE A: INSTITUTIONAL ACCUMULATION (>40% BUY SHARE) • Top 3 brokers corner ≥ 40% of total buy volume (BCR3) in heavy blocks. • Average buy ticket size is ≥ 1.4x sell ticket size. • Wyckoff Phase: STEALTH_ACCUMULATION or SPRING_SHAKEOUT. • Verdict: Valid institutional base.	RULE B: DISTRIBUTION TRAP WARNING (HARD REJECT!) • Top brokers are net sellers while price is up (churning green candles). • Retail buying heavily while Broker #58 or #45 dumps inventory. • Wyckoff Phase: EUPHORIA_DISTRIBUTION or ACTIVE_DUMP. • Verdict: DO NOT BUY — Trap in progress.
--	---

4. SEBON Statutory Frictions & Net Target Geometry

Friction / Statutory Factor	Statutory Rate	Impact on Net Profit & Trading Plan
SEBON Broker Commission	0.36% – 0.40% each way	~0.72% - 0.75% round-trip drag on gross traded turnover.
SEBON Regulatory Fee	0.015% each way	0.030% round-trip. DP Fee: Rs. 25 per transfer.
Final Capital Gains Tax (CGT)	10.0% Final Tax	Mandated under Finance Act 2083 for holdings < 365 days. Net targets must be calibrated net of 10% CGT.
Daily Circuit Band	±15% Daily Limit	Fourth Amendment Bylaws 2082. Expanded bands require strict stop-loss discipline.
T+2 Delivery Freeze	2 Full Working Days	Purchased shares cannot be sold for 2 sessions. Never chase Day 2+ green candles.

5. Step 3: Precision Execution & Position Sizing Protocol

Disciplined execution occurs in strict daily time windows to prevent retail whipsaws:

Time Window	Action Checklist & Non-Negotiable Institutional Gate
10:00 - 10:30 AM Pre-Market Scan	- Check Cash Defense Mode on top banner. If Active (breadth < 40%), stop: hold 70-80% cash. - Verify candidate has NO promoter lock-in expiry within 60 days.
10:30 - 11:00 AM Pre-Open Order Book	- Check Pre-Open OBIR (Order Book Imbalance Ratio). Must be ≥ +0.25 (buyer depth > 1.8x). - If projected open is > +2.5% above pivot: ABORT (Chase Cap Violated).
11:15 - 01:30 PM Live Order Execution	- Bypass 11:00-11:15 AM opening retail churn. Verify live RVOL ≥ 1.4x. - Verify Daily Prime Pick shows 'GO' signal. - Place TMS LIMIT ORDER strictly at [Entry Low]. NEVER use market orders.
03:15 - 04:00 PM Floorsheet Audit	- Audit Top 5 buyer/seller broker IDs: Did #58, #45, #34, #17 net accumulate? - Confirm BCR3 ≥ 40%. Set Stop-Loss floor in trading journal.

THE 2% PORTFOLIO RISK SIZING FORMULA (HALF-KELLY):

Open Calculators → Risk/Reward Position Sizer. Never risk > 2.0% of total capital on one setup:

Max Shares = ■ (Portfolio Capital × 0.02) / (Entry Low – Stop Loss) ■

Example: Capital = Rs. 5,00,000 | 2% Risk = Rs. 10,000 | Entry = Rs. 500 | Stop = Rs. 475 (Risk = Rs. 25/sh)

Max Position = 10,000 / 25 = 400 Shares (Rs. 2,00,000 capital outlay / 40% position).

6. Step 4: The 4-Tier Trailing Profit & Exit Engine

Price Milestone	Quantity to Sell	Stop-Loss Adjustment	Tactical Purpose
Target 1 Reached (+8% to +10% Net)	Sell 25% to 50% of shares	Move Stop to BREAKEVEN (Entry Price)	Zero-Loss Switch: Trade is now mathematically immune to capital loss.
Target 2 Reached (+18% to +25% Net)	Sell another 25% of shares	Trail Stop up to Target 1 Price	Locks in high double-digit profit; guarantees positive trade expectancy.
Target 3 / 52W High (+35% to +100%)	Hold remaining 25%-50%	Trail with 2-Day Close below 20-EMA	Captures full multibagger trend while allowing runner to compound.
Stop-Loss Triggered (-4.5% to -5.5%)	Sell 100% IMMEDIATELY	N/A — Position Closed	Absolute Capital Preservation: Prevents ±15% lower-circuit cascades.

7. Case Study: Live App Audit of HDL (Himalayan Distillery)

Applying the exact 6-point matrix to the real-time telemetry captured in the app for **HDL (LTP: Rs. 1,312)**:

Checkpoint	HDL App Telemetry	Institutional Diagnosis	Verdict
1. Valuation	P/E: 40.11x P/E × P/B: 372.2 Graham V*: Rs. 322.6	Margin of safety deficit: -306.6%. Trades at 4x intrinsic value. Piotroski score is only 4/9.	FAIL Extreme Multiple
2. Technicals	Price: Rs. 1,312 50 SMA: Rs. 1,285.8 RVOL: 4.39x Surge	Above 50 & 200 SMA. Turnover of Rs. 35.17 Cr confirms huge volume expansion.	PASS Strong Trend
3. Smart Money	BCR3: 57.5% (>40%) Broker #58: +16,867 kitta Net Inst: +10,544 kitta	Brokers #58, #29, and #57 cornered 57.5% of buy volume. Completely absorbed sellers #45 and #20.	PASS Accumulation
4. Risk / Reward	R:R Ratio: 1.71 : 1 Target 1: Rs. 1,390.7 Stop Floor: Rs. 1,266.1	Upside to Target 1 is only +4.7% net, while risk to support floor is -3.5%. Below 2.5:1 institutional hurdle.	CAUTION Sub-optimal R:R
5. Win Rate	Analog Win Rate: 31.3% Stance: HOLD / DO NOT CHASE	Historical backtests show chasing high-P/E breakouts near resistance fails 68.7% of the time.	DO NOT CHASE

HDL ACTIONABLE VERDICT FOR MAXIMUM PROFIT:

- **Existing Holders:** HOLD with a strict trailing stop at Rs. 1,266.1 (-3.5%). Partial profit harvest at Rs. 1,390.
- **Fresh Buyers:** **DO NOT CHASE** at Rs. 1,312. Wait for a low-volume pullback into the 50-day SMA support zone at **Rs. 1,265 – Rs. 1,285** with a stop at Rs. 1,240. This expands your Risk:Reward ratio from 1.71:1 to **> 3.2:1**.

8. The 10-Second Daily Routine to Screen for Profit

- Step 1 — Open 'Broker Flow Dominance':** Click [BCR3 > 40% Accumulation] pill to eliminate 95% of retail noise.
- Step 2 — Verify '100% Hunter' / Screener:** Select top scrip with Gates ≥ 6/8, DPI ≥ 65, and STRONG BUY stance.
- Step 3 — Inspect 'Entry / Exit Analyzer':** Ensure LTP is inside [Entry Zone] and strictly below [Chase Cap (+2.5%)].
- Step 4 — Verify Step 4 Broker Flow Card:** Must confirm INSTITUTIONAL ACCUMULATION and confirm NO Distribution Trap.
- Step 5 — Size Capital in 'Position Sizer':** Enforce 1.5% - 2.0% max portfolio risk. Get exact share count.
- Step 6 — Execute Order on TMS:** Place LIMIT order at [Entry Low] and log stop-loss in trading journal.

Risk Disclaimer: Equity trading on the Nepal Stock Exchange (NEPSE) involves substantial capital risk. Past backtested performance is no guarantee of future returns. This blueprint provides a rule-based quantitative methodology designed to maximize mathematical expectancy and defend capital. Always adhere strictly to SEBON ±15% statutory circuit rules and risk management.
